

A home network **built right** from the start.

Most ISP-supplied routers are built to a price, not to protect your home or keep up with it. This starter kit replaces your ISP router entirely with a professional-grade security gateway, then distributes fast, secure Wi-Fi to every room. Installed, configured and secured by SimpliHome — not left on default settings.

**SECURITY ROUTER • REPLACES
ISP ROUTER****Security Router**

Becomes the heart of your network in place of your ISP router. Dual 2.5G ports plus built-in, subscription-free protection against ransomware, intrusions and malicious sites.

8-PORT • POWER-OVER-ETHERNET**Managed PoE Switch**

Distributes wired connections around the home and powers both access points over a single cable each — no extra plug sockets needed.

WIRELESS ACCESS POINTS • WI-FI 6**Wi-Fi Access Points (x2)**

Two wall or ceiling-mounted access points replace weak router signal with strong, even Wi-Fi 6 coverage throughout the home.

*Quoted Wi-Fi speeds are the theoretical maximum combined speed of each device; actual real-world speeds depend on your internet subscription and on interference from neighbouring wireless networks.

Key Features

**Whole-Home Coverage**

Two access points reach rooms, floors and gardens your old router's signal couldn't, ending Wi-Fi dead spots for good.

**Subscription-Free Security**

Built-in ransomware, intrusion and web-filtering protection from day one — no ongoing licence fees.

**Powered Over One Cable**

Both access points draw power from the network switch, so no extra plug sockets or trailing cables are needed.

**Ready for More Devices**

Spare switch ports and PoE capacity are ready for cameras, extra access points, or other equipment later.

A Complete Replacement, Not an Add-On

Unlike a simple Wi-Fi extender, this kit replaces your ISP router entirely. The security router becomes the heart of your home network — handling security, routing and Wi-Fi coordination — while the switch and access points extend fast, secure connectivity to every room. Your ISP's incoming connection (via its modem or ONT) is still needed to bring internet into the home.
